Power BI 5
Security Role 5

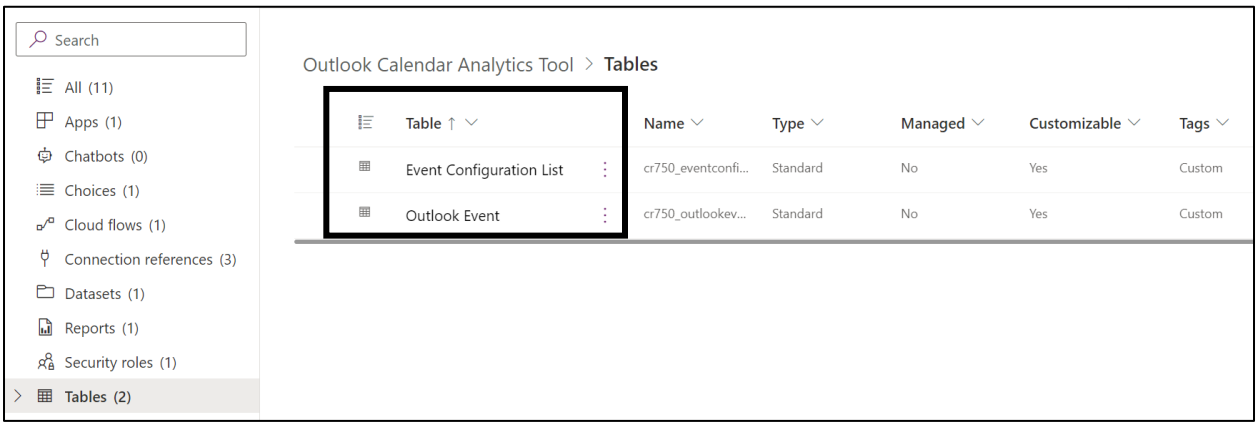
Introduction

The Power App solution contains one Power App, one scheduled Power Automate, three Power Automate connections, two Data verse tables, and one security role. We will be briefly going over each item to help you understand their purpose.

Data Source

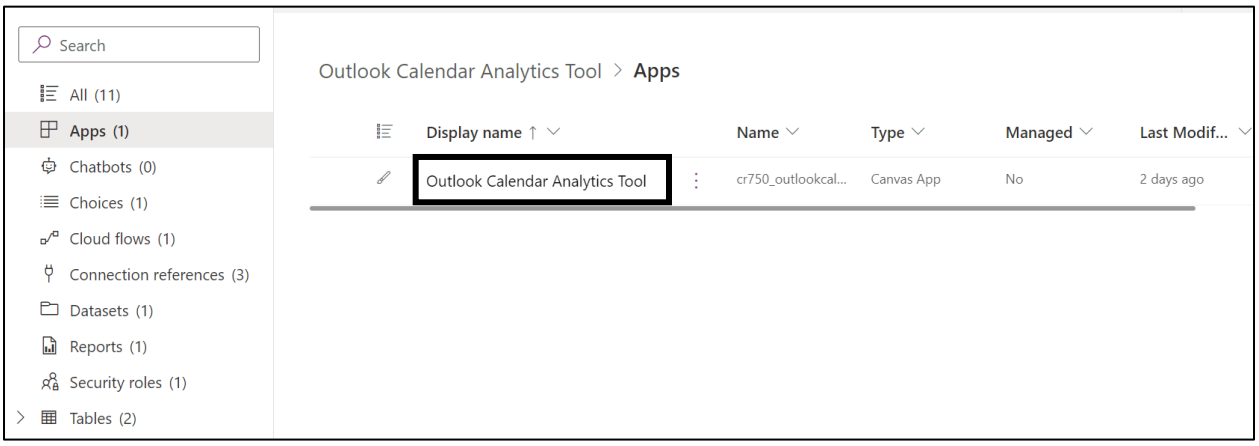
- The Data source used in this solution is a Data verse table. Use the below table to understand the purpose of both the Data Verse tables:

Table Name	Purpose of the Table
Event Configuration List	To store the request that is submitted from the PowerApps
Outlook event	To store the calendar events of the user that is fetched by the Power Automate Solution



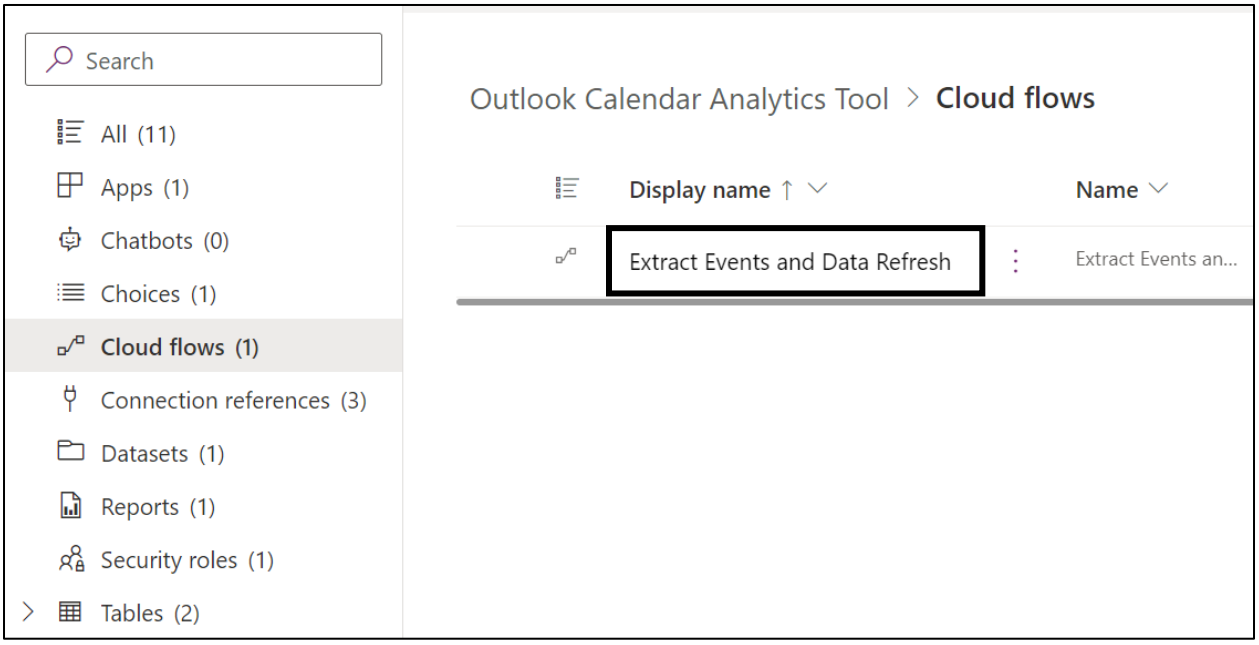
Power App

- This is a canvas app which contains one Power App screen, also known as the "configuration screen". This is where users will configure their Outlook Calendar Analytics Tool details.



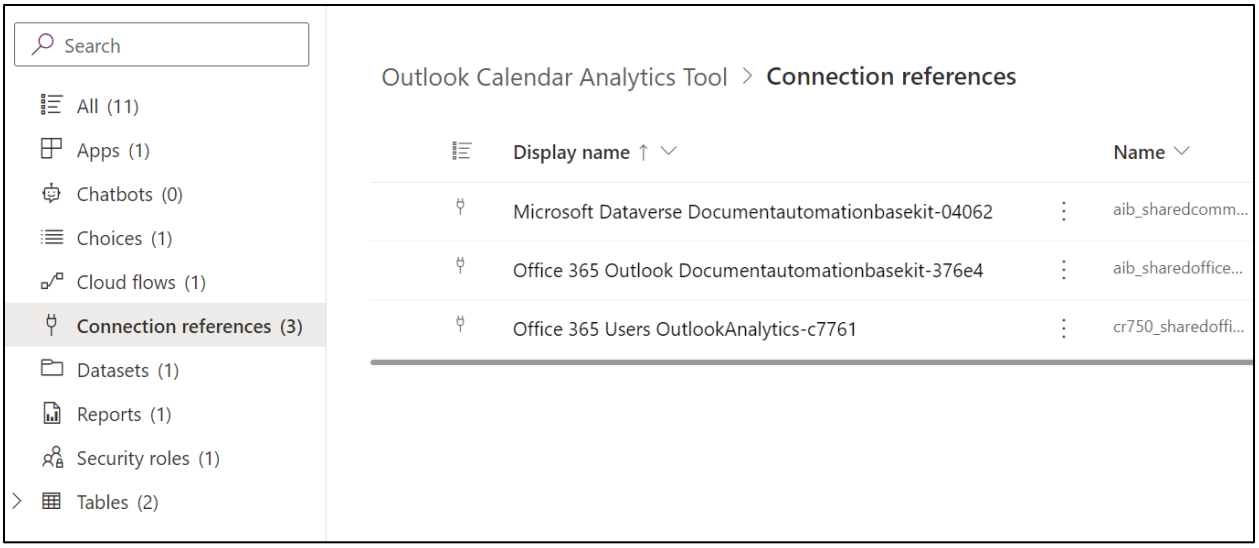
Power Automate Solution

- The Power Automate Solution is a scheduled solution that runs daily at 11PM UTC. Every day at this time, the flow will fetch the data from the user's calendar event based on the input provided in the PowerApps configuration form. It will perform operations such as: create a new record, update an existing record, or delete a record on the data verse table. The records are being maintained in the data verse table.



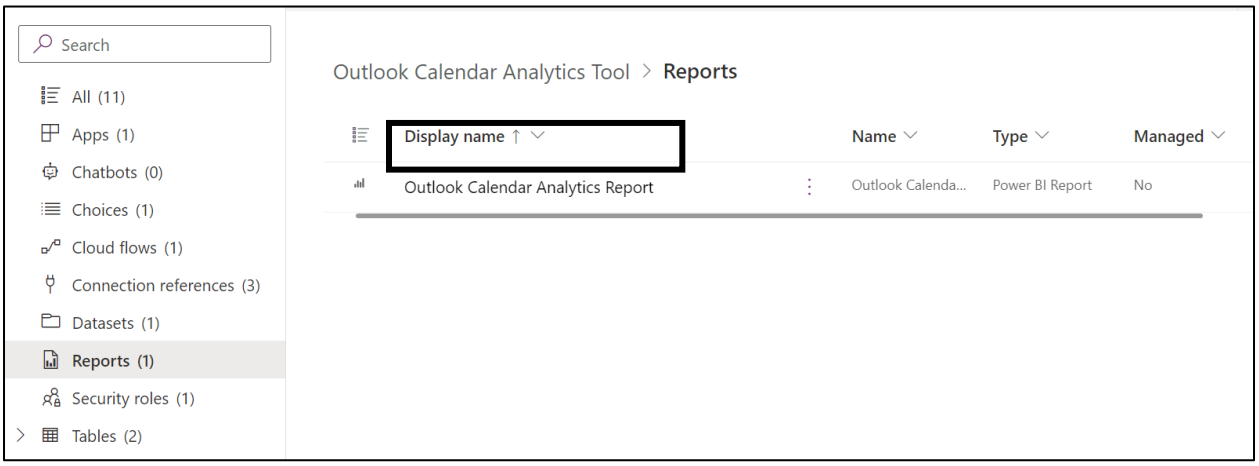
Power Automate Connections

- There are three connections which are used in the Power Automate. Below is the detailed information for each connection -
    - Microsoft Data verse Documentautomationbasekit-04062 – This connection is used to connect to data verse.
    - Office 365 Outlook Documentautomationbasekit-376e4 – This connection is used to connect to outlook, sending email.
    - Office 365 Users OutlookAnalytics-c7761 – This connection is used to fetch users' account properties.



Power BI

- This is a Power BI report which will fetch the data from Dataverse tables and displays insights about the events.



Security Role

There is one security role called the “Admin Privilege” which is used to give users access to the data verse tables used in this solution.
